Alpha measures the difference between an investment's expected returns based on its beta and its actual returns. A positive alpha indicates the investment has performed better than its beta would predict. A negative alpha indicates an investment has underperformed, given the investment's beta. Beta measures an investment's sensitivity to market movements. A beta greater than one indicates the investment is more volatile than the market. If beta is less than one, the investment is less risky than the market. Standard deviation measures the range of an investment's performance. The greater the standard deviation, the greater the investment's volatility. The Sharpe ratio indicates the reward per unit of risk by using standard deviation and excess return. The higher the Sharpe ratio, the better the investment's historical risk-adjusted performance.
